## What is a 10 Second Server?

A 10 Second Server is a powerful and simple virtual dedicated server that gives you total control and lets you get started fast!

Our virtualised servers are hosted in a telco-grade data centre located in Australia and we've got some serious bandwidth and a fast redundant link to the Internet which means your data will be delivered fast!

Plus because we're using virtualised technology, you will be doing your bit for the environment. Each virtualised server used in place of a physical server, assists in the reduction of greenhouse gases released into the atmosphere.

## All 10 Second Servers include

Each 10 Second Server comes with:

- Real-time provisioning
- 100Mbps internet connection utilising WebCentral's ultra fast hosting network
- 30GB outbound bandwidth allocation
- 24x7 Emergency phone support
- Free technical support during business hours
- Choice of Windows 2003, Windows 2008 or Linux Centos 5.2
- Pre-installed software includes IIS, .NET, Apache, PHP 5, MySQL
- Plus it's your server, you can install your own software.
